

The control room for AI agents

Policies, audit, budgets and verified results for any agent and any model — inside the customer's perimeter.

Claude Code | Codex | Antigravity | Ollama | any OpenAI API

Agents are everywhere. Control is not.

97% / 30%

of enterprise teams use AI coding assistants, but only about a third have full governance over them

Black Duck, June 2026, 831 respondents

46%

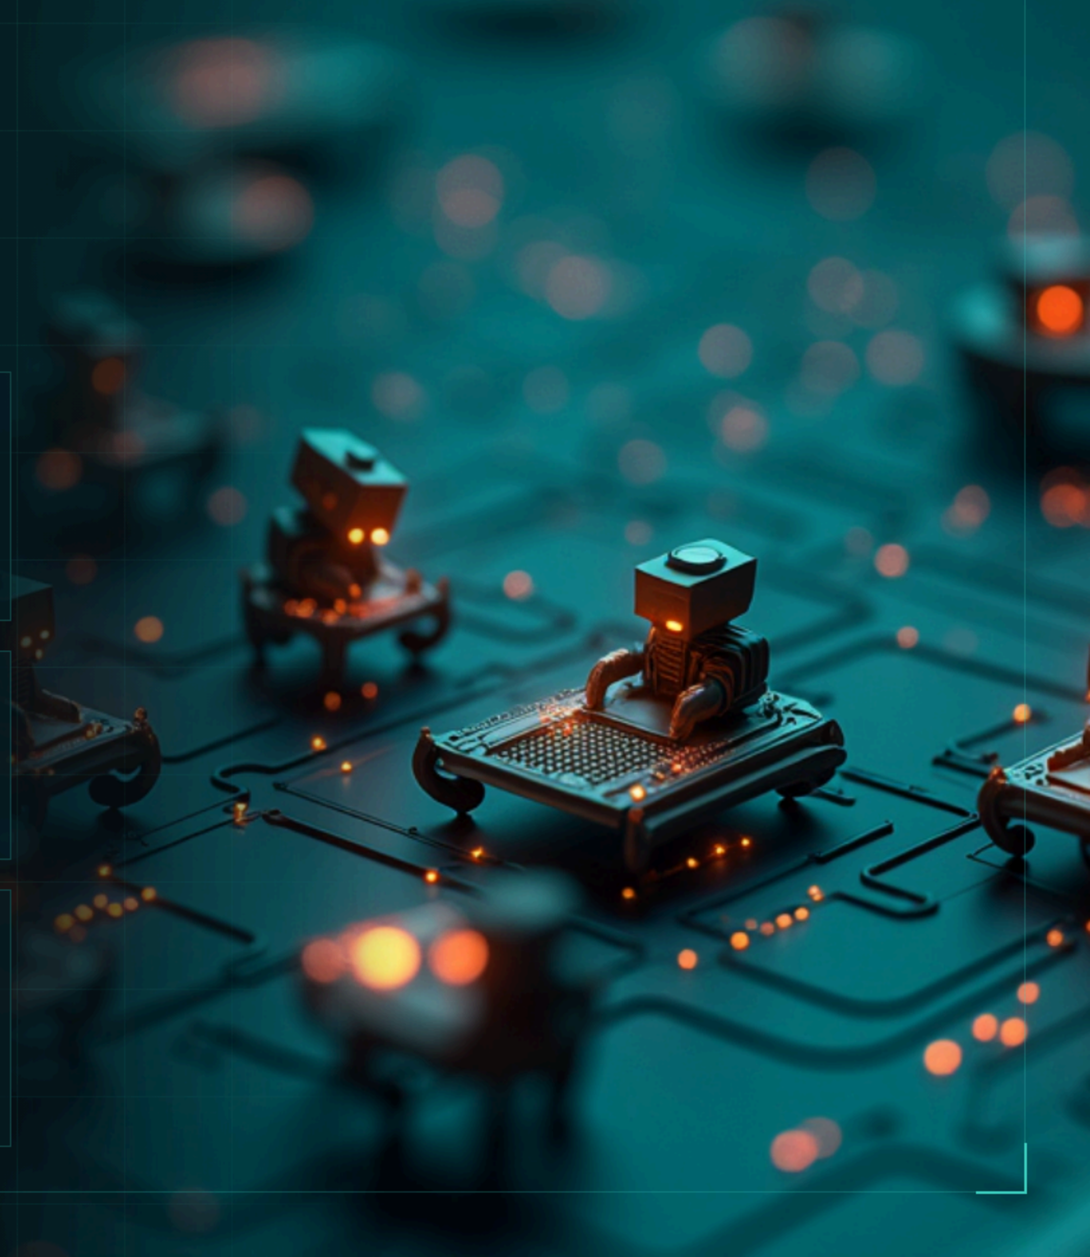

of developers distrust AI accuracy; only 31% use agents at all

Stack Overflow Developer Survey 2025

$1,500

Uber's cap per employee per month for each AI tool — after the annual budget was gone in 4 months

press reports, 2026

Companies pay for agents but can't trust them

Four questions no team running agents can answer today — and how ProjectHub answers them.

CTO · SECURITY	**“What did the agent do to our code and credentials while nobody watched?”**	→	**Approve before execution:** a risky step waits for a human decision; every decision goes to the audit log
HEAD OF ENGINEERING	**“The agent said ‘done’, but it doesn't work”**	→	**The system verifies, not the agent:** tests and acceptance criteria, looping until the checks pass
FINANCE	**“The agent bill keeps growing and we don't know what we pay for”**	→	**Cost per task:** tracking per agent, cheaper and local models where they are good enough
REGULATED INDUSTRIES	**“We can't hand our code to someone else's cloud or a single vendor”**	→	**Inside the perimeter:** any agents and models, local-first, no telemetry

The market grew 7× in a year and became a new category

ENTERPRISE SPEND ON AI CODING, $ BN

55% of all departmental enterprise AI spend goes to coding (Menlo Ventures, 2025)

65%+ of agent-using teams will see the IDE as optional by 2027; governance and validation move to dedicated platforms (Gartner, May 2026)

31% of developers already work with agents — the market is early on the curve (Stack Overflow 2025)

Gartner renamed its Magic Quadrant to “Enterprise AI Coding Agents” · Menlo Ventures, State of GenAI in the Enterprise, 2025

ProjectHub: a vendor-neutral control layer for agents

01 · CONTROL

Nothing risky without a human

- step approvals from desktop, phone or Telegram
- audit log, per-role agent permissions

02 · COST

Know what each task costs

- cost tracking per agent and per task
- model tiers, fallbacks and local models

03 · VERIFICATION

“Done” means verified

- acceptance criteria are checked by the system, not the agent
- Arena with an auto-judge, PR auto-review, dependency audit

04 · INDEPENDENCE

Any agent, any model

- local-first, no telemetry
- Windows, macOS, Linux

From task to merge — under control

The unit of work is a task, not a file. Agents run in parallel, each on its own git branch.

01
Task on the board
Tasks, decisions and docs live in git next to the code

02
Agents in parallel
Claude Code, Codex, Antigravity, local models — each in its own worktree

03
Human approval
Risky steps wait for a decision: from desktop, phone or Telegram

04
Verify “done”
Tests, lint, UI screenshot; loop until the criteria pass

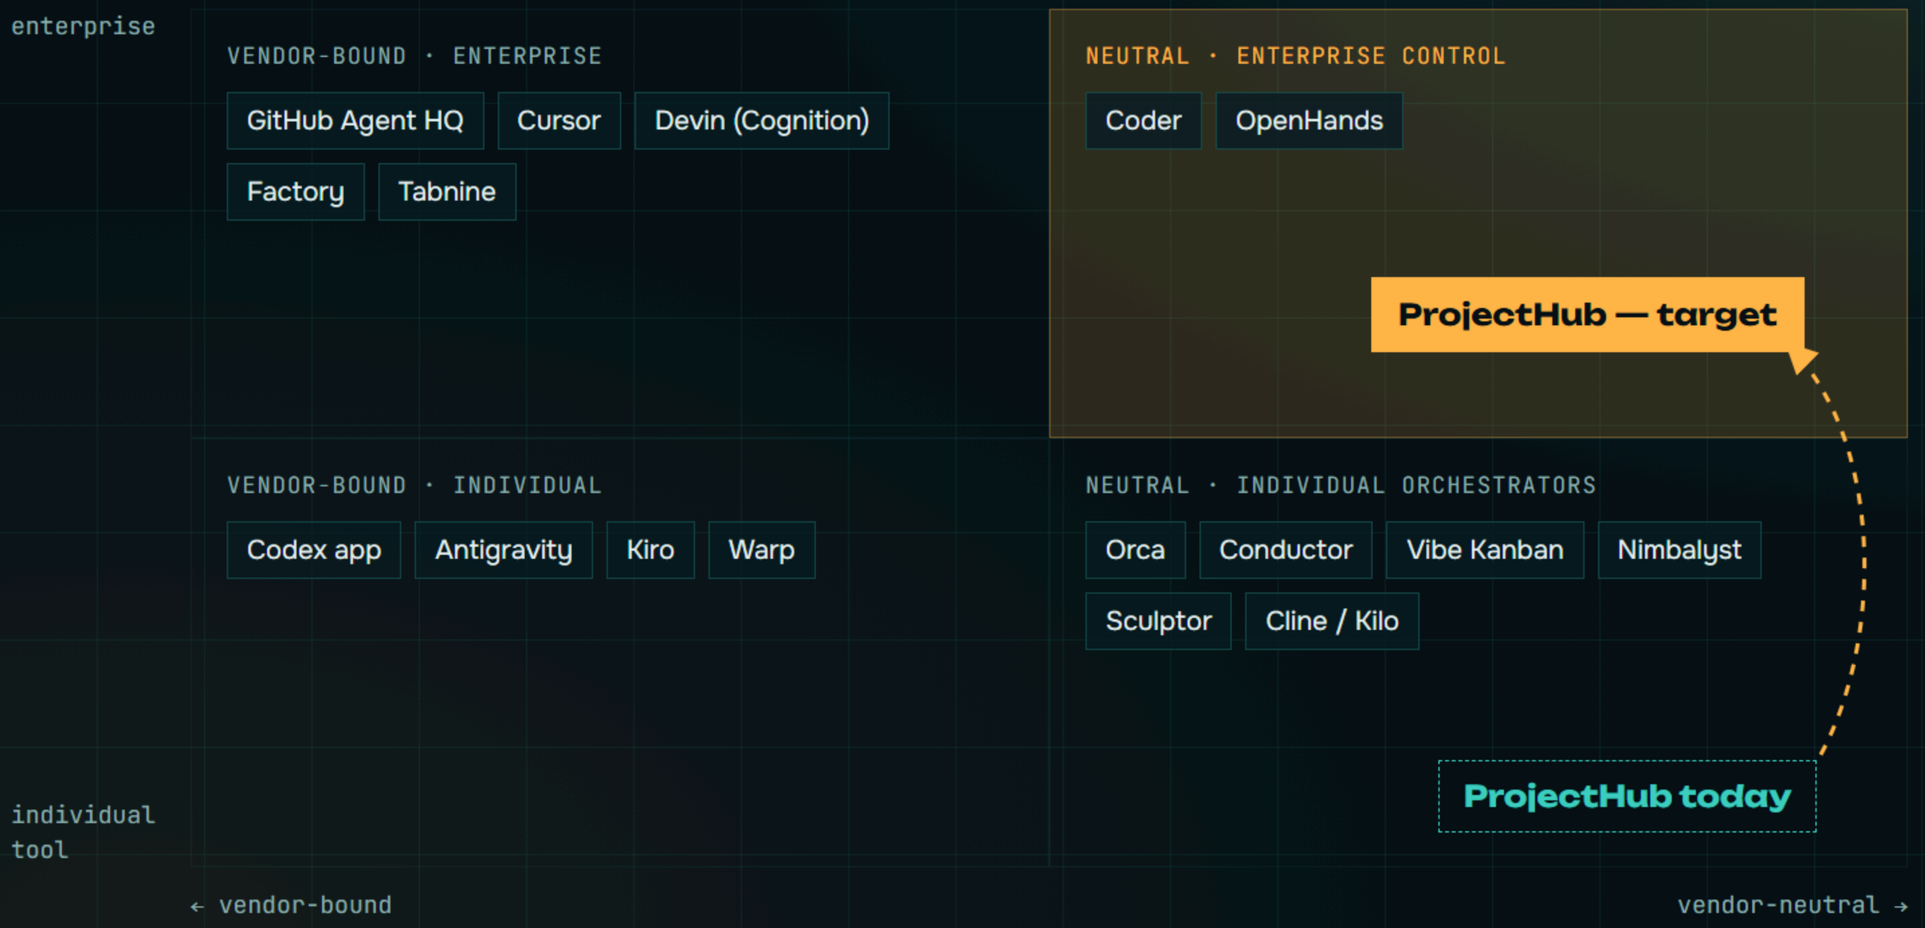

05
Pick and merge
An auto-judge compares variants, a human picks, the branch merges

UNDER THE HOOD — Audit log of every decision · semantic search over docs and project memory · an MCP server that lets external agents drive the environment

Six jobs a company pays for

BUYER'S JOB	WHO PAYS	ALREADY IN THE PRODUCT	READINESS
Control: agents do nothing risky without permission	CTO, security	human approval, audit log, role permissions, terminal hooks, computer use via a proxy	single-user only
Agent spend	CTO, finance	cost tracking per agent, model tiers and fallbacks, free local models	tracking, no limits
“Done” means verified	head of engineering	loop-until-done on acceptance criteria, Arena with auto-judge, PR auto-review, Security Health	high
Vendor independence, data sovereignty	regulated industries, EU	any model, local-first, no telemetry, Ollama and any OpenAI-compatible API	high
Throughput: many tasks in parallel	team lead	a worktree per agent, subtask planner, architect → coder → reviewer pipeline	high
Project knowledge for agents and people	team lead	ADRs, semantic search over docs, project memory, code graph	high

The open corner: neutral + enterprise

Independent orchestrators are free and offer no enterprise control.

Platforms add orchestration, but only for their own agents.

Coder and OpenHands are infrastructure and their own agent, not a control room for others'.

Placement is our assessment

Why we beat Orca and Signal AI

They run agents. ProjectHub also answers for what the agents did.

CAPABILITY	PROJECTHUB	ORCA	SIGNAL AI
Parallel agents in isolated branches	✓	✓	its own agent team
Any agents and models: CLI, API, local	✓	CLI agents only	no data
One approval queue for agent actions, from phone and Telegram	✓	– task-level gates only	“the user makes decisions”
Audit log of decisions, per-role permissions	✓	git, PR and activity history	no data
“Done” verified by the system against acceptance criteria	✓	– the agent self-reports completion	a QA agent
Auto-judge compares results of different agents	✓	– manual comparison	no data
Cost: price per task, model tiers and fallbacks	✓	cost estimates and plan limits	a Cost agent
No telemetry	✓	anonymous, opt-out	no data

Where Orca is stronger: 92.7K GitHub stars, Y Combinator backing, a mobile app, SSH, 20+ CLI agents, free. We don't compete on the terminal or IDE — we sell control and verification.

Signal AI — based on its public product diagram: a meta-orchestrator assembles a team of its own agents. Details unverified.

Built by agents — with its own methodology

7 weeks
since the first commit (Aug 28, 2026)

123K
lines of TypeScript

168
tasks closed

76
architecture decision records

213
unit test files

1
core author

Honestly: version 0.1.0, MIT license, no external users yet — getting them is step one of the plan.

Six steps to selling to companies

01 blocker

Team mode

Users, SSO, per-person permissions and audit. Today every device belongs to a single owner.

02 blocker

Control server

Company-wide policies and audit log instead of settings on every laptop. Built on ph-agent.

03

Budgets and limits

Limits per person, project, agent and task; hard stop on overrun; reports for finance.

04

Jira, ClickUp, Linear

Task sync with the company's tracker, or the product won't fit an existing process.

05

Any repository

Value in 5 minutes on a plain repository, without our own project template.

06

ROI reports

Cycle time, acceptance rate of agent results, cost per task, model comparison.

Also: split the license (client MIT, server commercial), sign the macOS build

A team on one host: everyone gets a branch

IN DEVELOPMENT Several people work in one project on one machine from their own laptops and phones. When a task is done, it merges through a queue.

Developer
laptop
takes task-12

Team lead
workstation
takes task-15 · reviews

Analyst
phone
takes task-18

SHARED HOST

ProjectHub on the team's computer or server

u/dev/task-12	Claude Code	agent working
u/lead/task-15	Codex + Ollama	awaits approval
u/analyst/task-18	Antigravity	in queue

one backlog · one numbering · keys and subscriptions stay here

MERGE QUEUE

1 Temp branch: main + task
↓
2 Checks and acceptance criteria
↓
3 Review by someone else
↓
4 **main**

↺ failure or conflict — back to the author

One source of truth
Tasks, numbering and the docs index live on the host — no duplicates, no backlog conflicts

One powerful machine
Agents, keys and subscriptions stay on the host; a laptop or phone is enough for each member

Only verified work hits main
Checked against the latest base and reviewed; one failure doesn't block the rest

Orca: SSH worktrees for a single developer · Coder: workspaces on Terraform and Kubernetes · GitHub merge queue: cloud and PRs only

Open core: the client is free, control is paid

PERSONAL

Free

MIT · funnel

- desktop and mobile client
- any agents and models, local too
- approvals, audit and cost — for yourself
- no limits on agents or projects

Independent orchestrators are free — there's no money in the UI alone

TEAM

$25–40

per seat per month

- shared host: members, a worktree each
- merge queue with checks and review
- SSO, shared policies and audit log
- budgets and limits, ROI reports
- sync with Jira and other trackers

Benchmarks: Copilot Enterprise $39 · Tabnine $39–59 · Cursor Teams $40

ENTERPRISE · ON-PREM

License

annual + support

- deployment in the perimeter, air-gapped
- SOC 2, audit export, SIEM
- member sandboxing, SLA and onboarding

Benchmark: Tabnine charges extra for air-gapped

Plan: proof → Team → Enterprise

Months 0-3

Proof

- ☐ public client release, focus on Windows and any model
- ☐ Claude Code community, Hacker News, Product Hunt, Reddit
- ☐ 5-10 design-partner teams for pilots
- ☐ before/after measurements

Done when: we have numbers for cost per task, cycle time and PR acceptance rate

Months 3-6

Team edition

- ☐ shared host: members, a worktree each
- ☐ merge queue with checks and review
- ☐ shared policies, audit, budgets
- ☐ Jira sync
- ☐ first paid pilots

Done when: the first companies pay for seats

Months 6-12

Enterprise and on-prem

- ☐ deployment in the customer's perimeter
- ☐ integration partners
- ☐ air-gapped for regulated industries

Done when: annual licenses with regulated customers

Pre-seed: the risks and our answers

BENCHMARKS BY STAGE

Pre-seed: median stake for $500K	~7%
Seed: median investor stake	~18–20%
Series A: Conductor, OpenHands	$19–22M

Pre-seed is the first money for the product and pilots, usually from angels and accelerators (Orca is a Y Combinator company). Seed and Series A come after users and metrics.

RISK → ANSWER

Platforms will build orchestration in	GitHub, OpenAI and Google won't govern their competitors' agents; a multi-vendor company won't hand control to one of them
Competing orchestrators are free	Customers pay for control, audit and budgets, not for the UI
CLI vendors change their terms	Multiple engines and local models; no feature depends on a single vendor
A one-person team	First funding fixes it: the first hires go to the Team edition and sales
