

GO-TO-MARKET AND INVESTOR MATERIALS

ProjectHub: market, business jobs and positioning

Which business problems ProjectHub solves, what is missing before it can sell to companies, and how to position it for investors.

October 15, 2026 Product version 0.1.0 Companion to ProjectHub-pitch-en.pdf

01 Summary

As yet another convenient agent orchestrator, ProjectHub will not make money: Conductor, Vibe Kanban and Nimbalyst do that job for free. What is worth selling is a vendor-neutral control layer for AI agents in software development: policies, audit, budgets and verified results.

That layer is paid for by a company, not an individual developer. The team and server side is exactly what the product lacks today — the main gap before going to market.

Investor thesis. Companies run Claude, Codex and Gemini agents at the same time, but cannot control what those agents do, what they cost, or whether a task is really done. ProjectHub provides control, audit and result verification for any agent and any model, running inside the customer's perimeter.

02 The product today

ProjectHub is a desktop Agentic Development Environment (ADE) for Windows, macOS and Linux. The unit of work is a task, not a file: agents pick tasks from the board and work in parallel, each in its own git worktree, while a human approves risky steps and picks the best result.

- **Agents.** Claude Code, Codex, Google Antigravity, any model with an OpenAI-compatible API, local models via Ollama. The user picks the model; there is no default vendor.
- **Orchestration.** Swarm Arena (one task to several agents, an auto-judge, merge of the winner), an architect → coder → reviewer pipeline, a subtask planner, a loop-until-done on acceptance criteria, automations.
- **Control.** Human approval from desktop, phone and Telegram, audit log, per-role permissions, cost tracking, dependency and secret scanning.
- **Project knowledge.** Tasks, docs and ADRs in git (Backlog.md), semantic search over docs, project memory, a built-in MCP server.
- **Control from anywhere.** Mobile client, Telegram Mini App, voice, federation of several machines.

~7 weeks of development, first commit Aug 28, 2026	**~123K** lines of TypeScript	**168 / 76** tasks closed / architecture decision records
213 unit test files	**1** core author	**0.1.0** version, MIT license, no external users yet

The product was built by agents using its own methodology — in itself evidence that the approach works.

03 Market

The market is growing several-fold while governance lags behind: 97% of enterprise teams use AI coding assistants, but only 30% have full control over them.

- **Money.** Menlo Ventures (survey of 495 US executives, November 2025) estimates enterprise spend on AI coding at **$4.0B** in 2025, up from ~$550M in 2024 — roughly 7×. That is 55% of all departmental AI spend; total enterprise GenAI was $37B.
- **Category.** Gartner (May 20, 2026) renamed its Magic Quadrant to "Enterprise AI Coding Agents" and forecasts that by 2027 more than 65% of agent-using teams will see the IDE as optional, with governance and validation moving to dedicated platforms. Selection criteria: governance, support, pricing clarity, deployment and regulatory requirements.
- **Broad estimates.** MarketsandMarkets: $8.14B in 2025, $127B by 2032 (48% CAGR), with a broad market definition. A figure of "$9.8–11B annual revenue as of April 2026" is attributed to Gartner but does not appear in the release itself ⚠ unverified.
- **Adoption.** 84% of developers use or plan to use AI, but only 31% use agents; 46% distrust AI accuracy (Stack Overflow 2025, 49K respondents).
- **Governance.** 97% of teams use AI, 30% have full governance, 68% call it critical, 64% worry about vulnerabilities, 84% want a human in the loop (Black Duck, June 2026, 831 respondents; a security vendor's study).
- **Cost — the main new pain of 2026.** Uber reportedly burned its annual AI budget in 4 months and capped usage at $1,500 per employee per month per tool. Microsoft reportedly limited Claude Code at ~$2,000 per engineer per month ⚠ unverified.

04 Competition

Orchestrators of comparable scale exist only at the platform vendors and are tied to their own agents; independent orchestrators are free and give companies no control.

Type: O — orchestrates several third-party agents; A — its own agent.

PRODUCT	TYPE	WHAT IT DOES AND THE MONEY
GitHub Agent HQ / Mission Control	O	Announced Oct 28, 2025; Claude and Codex available since Feb 2026 for Pro+/Enterprise. One task can go to several agents for comparison — a direct analog of Arena. Business $19, Enterprise $39 per seat.
Cursor (Anysphere)	A (+O)	Cursor 2.0: up to 8 parallel agents on worktrees, its own Composer model. Teams $40. SpaceX reportedly announced an all-stock acquisition for $60B (Jun 16, 2026) ⚠.

PRODUCT	TYPE	WHAT IT DOES AND THE MONEY
Cognition (Devin + Windsurf)	A	Acquired Windsurf (Jul 2025). A $2B+ round at a $48B valuation (Sep 2026) ⚠ `single source`. ~$900M annual revenue by Sep 2026.
Google Antigravity	A + agent manager	Version 2.0 at I/O, May 19, 2026. Free tier, Pro $20 / Ultra $100–200; enterprise via Google Cloud consumption ⚠ `pricing`.
OpenAI Codex app	A (+O own threads)	Launched Feb 2, 2026, macOS. Parallel threads, worktrees, automations.
Claude Code	A	Isolated sessions on worktrees, cloud routines. Max $100/$200; a Team seat with Claude Code ~$125/month ⚠.
Conductor	O	Mac only. Runs Claude Code, Codex and Cursor in parallel on worktrees. Series A $22M (company website).
Vibe Kanban (BloopAI)	O	Open source: kanban and 10+ agents on worktrees, remote access over SSH. The closest analog in concept.
Nimbalyst (formerly Crystal)	O	Electron, parallel Claude Code on worktrees, kanban; free.
Sculptor (Imbue)	O	Agents around Claude Code in Docker containers; free in beta; Windows only via WSL.
Warp	A	Positions itself as an “Agentic Development Environment” — the same term. Build $20, Business $50, Max $200.
Factory.ai	A	$150M at a $1.5B valuation (Apr 2026); per trackers, $200M at $5B (Sep 2026) ⚠.
Tabnine	A, on-prem	$39 and $59 per seat; SaaS, VPC, on-prem, air-gapped ⚠ `pricing`.
OpenHands (All Hands)	A, open core	Series A $18.8M (Nov 2025). Self-hosted on Kubernetes, RBAC, audit.
Coder	O / infrastructure	AI Bridge and Agent Boundaries (Jan 2026); Coder Agents inside the customer perimeter with any model (May 2026).
Cline / Kilo / Roo	A, BYOK	Open source; Kilo raised an $8M seed (Dec 2025), 500+ models.

What investors pay for

- **Mega-deals go to owners of their own agent and model:** Cursor, Cognition, Factory; Google paid $2.4B to license Windsurf and hire its team (Jul 2025).
- **Pure orchestrators raise orders of magnitude less:** Conductor — $22M Series A, OpenHands — $18.8M, Kilo — $8M seed.
- **Takeaway:** an orchestration layer is worth a seed or Series A unless it has an enterprise wedge (governance, self-hosted). The layer's main risk is platforms building orchestration in.

05 Enterprise pain points

- **Governance and audit.** 30% have full governance, 68% call it critical. The market is responding: Coder (AI Bridge, Boundaries), OpenHands Enterprise (RBAC, audit), IBM Bob self-hosted (Oct 1, 2026, up to air-gapped).
- **Cost.** The Uber case; per Ramp, the top 1% of companies spend ~$7,500 per employee per month ⚠.
- **Trust and verification.** 66% of developers say AI answers are “almost right”; the bottlenecks are manual review (52%) and security testing (51%).
- **Regulation.** EU AI Act: high-risk obligations postponed to Dec 2, 2027; coding agents are usually not high-risk. Demand for audit comes rather from SOC 2, ISO 27001 and DORA ⚠ `no agent-specific data`.
- **Data sovereignty.** 68% of executives call it a concern (IBM survey, general).

06 Business jobs ProjectHub solves

BUYER'S JOB	WHO PAYS	ALREADY IN THE PRODUCT	READINESS
Control: agents do nothing risky without permission	CTO, security	human approval on desktop, phone and Telegram; audit log; per-role permissions; terminal hooks; computer use via an allowlisted proxy	`single-user only`
Agent spend	CTO, finance	cost tracking per agent, model tiers with fallbacks, free local models	`tracking, no limits`
“Done” means verified	head of engineering	loop-until-done on acceptance criteria, Arena with auto-judge, PR auto-review, Security Health	`high`
Vendor independence and sovereignty	regulated industries, EU	any model, local-first, no telemetry, Ollama and any OpenAI-compatible API	`high`
Throughput	team lead	a worktree per agent, subtask planner, architect → coder → reviewer pipeline	`high`
Project knowledge	team lead	ADRs, semantic search over docs, project memory, code graph	`high`

A separate advantage is **Windows**: Conductor is Mac-only, the Codex app is macOS-only, and Sculptor runs on Windows only via WSL.

What is missing, by priority

1. **Team mode: users, SSO, per-person permissions and audit** (TASK-133). Today every device belongs to a single owner, so a company has nothing to buy. Blocker number one. The first step is a **shared host** (decision-84, TASK-142): several people work in one project on one machine from

their own laptops and phones, each in their own worktree, and finished tasks merge through a queue with checks against the latest base and review by someone other than the author. One backlog and one numbering on the host remove the conflicts that teams with separate repository copies hit. Competitors lack this: Orca's SSH worktrees serve a single developer, Coder needs Terraform and Kubernetes, GitHub's merge queue is cloud- and PR-only.

2. **A server side.** Companies need shared policies and a shared audit log, not settings on every laptop. Built on ph-agent (TASK-130); the paid edition should center on the control server.
3. **Budgets and limits, not just tracking:** limits per person, project, agent and task, a hard stop on overrun, reports for finance.
4. **Sync with Jira, ClickUp, Linear** (TASK-128/129): without it ProjectHub won't fit a company's process.
5. **Work with any repository without our own template:** value in 5 minutes on a plain repository.
6. **ROI reports for management:** cycle time, acceptance rate of agent results, cost per task, model comparison.
7. **A licensing decision:** the client stays MIT; the control server and enterprise modules go under a commercial license.
8. **Release readiness:** a signed macOS build, the first external users.

> Voice, TTS, the Telegram Mini App and machine federation are visible differentiators, but they dilute the pitch. Show them as “control from anywhere”, not as the core.

07 Positioning

A · RECOMMENDED

A vendor-neutral control layer for agents

Control, audit and verified results for any agent and model inside the customer's perimeter.

Why now: Gartner, Black Duck, Uber's caps.

Moat: platforms won't govern their competitors' agents.

B

A free tool for individual developers

Works as a funnel, not as a business: competitors in this segment are free.

08 Go to market and pricing

Months 0–3

Proof

- public client release (MIT), focus on Windows and any model
- Claude Code community, Hacker News, Product Hunt, Reddit
- 5–10 design-partner teams
- before/after measurements

Done when we have numbers for cost per task, cycle time and PR acceptance rate

Months 3–6

Team edition

- shared host: members, a worktree each
- merge queue with checks and review
- SSO, shared policies, audit, budgets
- Jira sync
- first paid pilots

Done when the first companies pay for seats

Months 6–12

Enterprise and on-prem

- deployment in the customer's perimeter
- integration partners
- air-gapped for regulated industries

Done when there are annual licenses with regulated customers

EDITION	PRICE	WHAT'S INCLUDED
Personal	free (MIT)	everything for one person: desktop and mobile client, any agents and models, approvals, audit and cost tracking for yourself; no limits on agents or projects. The funnel
Team	$25–40 per seat per month	shared host with members and a merge queue, control server, SSO, shared policies and per-person audit, budgets and ROI reports, Jira and other trackers. Benchmarks: Copilot Enterprise $39, Tabnine $39–59, Cursor Teams $40
Enterprise / on-prem	annual license + support	deployment in the perimeter, air-gapped; SOC 2, audit export, SIEM; member sandboxing; SLA and onboarding

09 What to tell investors

- **Traction.** In 7 weeks one developer, working with agents, produced about 123K lines of code, closed 168 tasks, wrote 76 ADRs and 213 test files. Investors will ask about external users — there are none yet; the first phase of the plan answers exactly that question.
- **Stage: pre-seed.** The product exists; there are no users or revenue yet, and there is one founder. This is the first money for the product and pilots, usually from angels and accelerators (Orca is a Y Combinator company). Benchmarks per Carta: the median pre-seed stake is about 7% of the company for $500K, seed about 18–20%. The Series A rounds of Conductor ($22M) and OpenHands ($18.8M) are the next step, after users and metrics. No round is open yet: the amount and terms are not set.

RISK	ANSWER
Platforms will build orchestration in	GitHub, OpenAI and Google won't govern their competitors' agents; a multi-vendor company won't hand control to one of them
Competing orchestrators are free	Customers pay for control, audit and budgets, not for the UI
CLI vendors change their terms	Multiple engines and local models; no feature depends on a single vendor
A one-person team	First funding fixes it: the first hires go to the Team edition and sales

Data caveats. Some 2026 figures exist only in secondary sources (marked ⚠): the Cognition and Factory valuations, the SpaceX–Cursor deal, Claude Team pricing. The Gartner report could not be opened at the source. The Black Duck survey was run by a security vendor. Re-check these figures before meeting investors.
